

METHOD FOR THE SYNTHESIS OF A BENZIMIDAZOLE COMPOUND

The present invention relates to an improved process for the synthesis of 5-methoxy-2(((4-methoxy-3,5-dimethyl-2-pyridinyl)methyl)thio)-1H-benzimidazole (pyrmetazole) used in
5 the manufacturing of 5-methoxy-2-[[[(4-methoxy-3,5-dimethyl-2-pyridinyl)-methyl]sulphinyl]-1H-benzimidazole and its (*S*)-enantiomer, known under the generic names omeprazole and esomeprazole, respectively.

10 Background of the invention and prior art

An efficient process for synthesis of omeprazole is described in WO 97/22603, which is hereby incorporated by reference. In the described process, there is no need for additional purification or isolation steps in between the different reaction steps and a more efficient process is hence offered. Further adding to the simplicity, the reaction sequence is carried
15 out in one common solvent system throughout the whole process. However, there is still a need of a new, even more convenient and more efficient process for the manufacturing of pyrmetazole in higher yield and with higher purity, and which process provides increased yield of the final products, omeprazole or esomeprazole.

20

Summary of the invention

The object of the invention is to provide a process for the manufacturing of pyrmetazole in a high yield and with a high purity, which is especially important for the asymmetric synthesis of esomeprazole. The process, i.e. the reaction sequence from pyrmetethyl alcohol
25 (Ia) to pyrmetazole (I), is carried out, without any isolation or purification of intermediates, in one solvent system common for the reaction sequence, to obtain a reproducible high yield of the final products, omeprazole or esomeprazole. Such a process eliminates time consuming steps for isolation or purification of intermediates and save time on avoiding solvent changes in the process, thus making the process more efficient and with a high
30 production capacity.

Detailed description of the invention

The process comprising the following reaction steps:

Step 1: Pyrmethyl alcohol (Ia) + chloro-dehydroxylating agent \rightarrow pyrmethyl chloride (Ib)

Step 2: Pyrmethyl chloride (Ib) + metmercazole (Ic) \rightarrow pyrmetazole (I)

is performed in a solvent system common for the reaction sequence, comprising a water immiscible organic solvent and a specified amount of water added. This process is used for the synthesis of pyrmetazole, an intermediate in the synthesis of omeprazole or esomeprazole.

In Step 1, the conversion of pyrmethyl alcohol into pyrmethyl chloride, hereinafter referred to as chloro-dehydroxylation, the pyrmethyl alcohol (Ia) is reacted with an excess of a chloro-dehydroxylating agent giving an alkyl chloride, i.e. pyrmethyl chloride (Ib). The chloro-hydroxylating agent can be selected from thionyl chloride, cyanuric chloride, phosphorous trichloride, phosphorous pentachloride, and phosphorous oxychloride. The reaction is performed at a temperature of -5°C to $+45^{\circ}\text{C}$, preferably between -5°C and $+35^{\circ}\text{C}$, most preferably between $+10^{\circ}\text{C}$ and $+35^{\circ}\text{C}$, or between $+25^{\circ}\text{C}$ and $+35^{\circ}\text{C}$. In the case, where no water is present from the beginning, the conversion of the reactants into the product, pyrmethyl chloride (Ib), will not go to completion. However, the reaction can be re-started by adding a specified amount of water and the reaction thereafter can be completed. Thus, if the reaction ceases, it is possible to re-start it with addition of a specified amount of water.

According to Step 2 above, pyrmethyl chloride (Ib), provided from Step 1, is reacted with metmercazole (Ic) under alkaline conditions, e.g. an alkaline aqueous solution of metmercazole (Ic) is prepared and mixed with the pyrmethyl chloride (Ib). The reaction is preferably carried out at a temperature of $+30^{\circ}\text{C}$ to $+60^{\circ}\text{C}$ during a prolonged period of time. Metmercazole (Ic) is charged in approximately stoichiometric amount to the pyrmethyl chloride (Ib). The invention may also be used in combination with a phase

transfer catalyst, for instance a quarternary amine, such as tetrabutyl ammonium bromide. The two phases formed are separated, the aqueous phase may be extracted with a water immiscible organic solvent such as toluene, and the organic phase may be extracted with water.

As pyrmethyl alcohol (Ia) has a disadvantageous effect on the following reaction steps, it is important to minimise the content of the pyrmethyl alcohol (Ia) present.

The reaction sequence according to Step 1 and Step 2 described above is carried out in one solvent system. The solvent system used for the present reaction sequence comprises a water immiscible organic solvent, such as halogenated, aliphatic or aromatic hydrocarbons or esters, for example toluene, ethyl acetate and methylene chloride, and a specified amount of water added. Preferably, toluene may be used as the water immiscible organic solvent.

The water content in the solvent system shall preferably be near or above the saturation point of the organic solvent used. By this, a higher amount of pyrmethyl alcohol (Ia) is allowed to react and form the pyrmethyl chloride (Ib). The amount of water may be added before, during or after the charging of the chloro-dehydroxylating agent, such as thionyl chloride. An optimum range of water present during Step 1 is between 0.3 and 5.5 mg water/ml of water immiscible organic solvent, preferably between 0.3 and 5.0 mg water/ml, or between 0.4 and 2.4 mg/ml, and most preferably between 1.0 and 2.4 mg/ml. If the water content is lower than the saturation point of the organic solvent used i.e. for toluene, less than 0.3 mg/ml, the reaction is slow and it has a tendency to stop before full conversion has been achieved. In average, a conversion of 25-50 % is obtained when toluene, having a water content of less than 0.1 mg/ml, is used as the solvent system. Such a reaction leads to a high content of pyrmethyl alcohol (Ia) in the reaction mixture after Step 1. It is inconvenient to have a high content of pyrmethyl alcohol present in the crude product of pyrimetazole (I) after Step 2. We have found that if about 1 %, or more, of pyrmethyl alcohol (Ia) is left in the reaction mixture, this component has an adverse effect

on both the turnover and the enantioselectivity achieved in the asymmetric oxidation of pyrimetazole into esomeprazole.

The present invention is an improvement of the first two steps in the process described in WO 97/22603. The reaction sequence, from pyrimethyl alcohol (Ia) via pyrimethyl chloride (Ib) to pyrimetazole (I), is carried out in one common solvent system, comprising a water immiscible organic solvent and a specified amount of water, which is used throughout the reaction sequence. The new improved process for the manufacture of 5-methoxy-2(((4-methoxy-3,5-dimethyl-2-pyridinyl)-methyl)-thio)-1H-benzimidazole (pyrimetazole) can in more detail be described by Step 1 and Step 2 below, both performed in a water immiscible organic solvent and with a specified amount of water added:

Step 1: Chloro-dehydroxylation:

Reacting (4-methoxy-3,5-dimethyl-2-pyridinyl)methyl alcohol (pyrimethyl alcohol) of the formula Ia

with a chloro-dehydroxylating agent, such as thionyl chloride, providing (4-methoxy-3,5-dimethyl-2-pyridinyl)methyl chloride (pyrimethyl chloride) of the formula Ib

Step 2: Coupling reaction:

Reacting (4-methoxy-3,5-dimethyl-2-pyridinyl)methyl chloride of the formula Ib, prepared in Step 1 above, with 2-mercapto-5-methoxybenzimidazole (metmercazole) of the formula

5 Ic

in the presence of a base such as, sodium hydroxide or potassium hydroxide; providing 5-methoxy-2(((4-methoxy 3,5-dimethyl-2-pyridinyl)methyl)thio)-1H-benzimidazole (pyrmetazole) of the formula I

15 The pyrmetazole is then further processed to the final products, omeprazole or esomeprazole.

The present invention provides an improvement associated to Step 1 in the manufacturing of pyrmetazole, by a more complete conversion and reproducible yield of pyrmethyl alcohol (Ia) and pyrmethyl chloride (Ib) respectively. The advantageous effect of water present during the chloro-dehydroxylation reaction, Step 1, is surprisingly as this type of chloro-dehydroxylating agents are regarded as incompatible with water, i.e. thionyl chloride reacts violently with water and excess of thionyl chloride is usually hydrolysed after a reaction by an addition of water.

More specifically, the aim with the present invention has been to improve Step 1, the chloro-dehydroxylation step, in the process for preparation of pyrimetazole (I) used in the synthesis of omeprazole or esomeprazole, i.e. to obtain a more efficient conversion of the pyrimethyl alcohol (Ia), a reaction step that is common for both the synthesis of
5 esomeprazole and omeprazole. It has, surprisingly, been shown that presence of a specified amount of water reduces the amount of remaining pyrimethyl alcohol (Ia) i.e. the conversion of pyrimethyl alcohol (Ia) according to Step 1 is more complete. A small amount of water present in the reaction mixture lead to a better conversion, and a more efficient use of pyrimethyl alcohol (Ia) and a product of high yield and high purity.

10 According to the process described in WO 97/22603 the crude product, pyrimetazole (I), from Step 2 is further processed to omeprazole in a consecutive reaction sequence. There is no isolation or purification performed during the reaction sequence, which is preferable with respect to process simplicity and economy. However, residues of pyrimethyl alcohol
15 (Ia) from Step 1 have been found in the product mixture of pyrimetazole (I) in Step 2.

It has been found that traces of pyrimethyl alcohol (Ia) have disadvantageous effects upon the oxidation of pyrimetazole (I) to omeprazole and especially then in the asymmetric oxidation of pyrimetazole (I) to esomeprazole. Such traces of pyrimethyl alcohol (Ia) results
20 in reduced turnover and enantio-selectivity in the asymmetric oxidation and give a product with less purity and in lower yield. Thus, the obtained enantiomeric excess of esomeprazole is depending on a high purity of the intermediate compound pyrimetazole (I). The impact of levels from about 1% or above of pyrimethyl alcohol has been investigated.

25 The presence of water in the chloro-dehydroxylation reaction, Step 1, is of outmost importance to obtain pyrimethyl chloride (Ib) and thereby pyrimetazole (I) in high yield and with a high purity without any requirements of isolation or purification. The required amount of water may be charged from the beginning, or being added during or after the addition of a suitable chloro-dehydroxylating agent, such as thionyl chloride. Preferably a
30 small specified amount of water is charged at the beginning of the reaction. The addition of

water during the process may also be used as a way to re-start an incomplete reaction to improve the yield and product purity. The present invention provides a more efficient use of the chloro-dehydroxylating agent.

5 Furthermore, the presence of water in Step 1 provides a safer, and more robust process, as it also reduces the different risks connected with this type of reactions, i.e. such as accumulation of thionyl chloride or reactive reaction intermediates. Thus, avoiding the risk of a late rapid exothermic reaction to occur. However, there exists other options to get complete and /or high conversion of pyrmethyl alcohol (Ia) in Step 1, and to avoid, or
10 minimise, traces of pyrmethyl alcohol (Ia) in Step 2, These options can be, for instance, an extended reaction time, raised reaction temperature or increased excess of thionyl chloride. However, these options are not favored in view of an effective production of the final products, omeprazole and esomeprazole.

15

The examples that follow will further illustrate the improved process of the invention. These examples are not intended to limit the scope of the invention as defined hereinabove or as claimed below.

20 EXAMPLES

Example 1

Pyrmethyl alcohol, 8.82 g (52.7 mmol), was dissolved in toluene, saturated with water, 74
25 ml (water content 0.4 mg/ml according to Karl Fisher titration). To the stirred solution, at 10°C, thionyl chloride, 8.15 g (68.5 mmol), was added slowly over 60 minutes (flow rate 0.083 ml/min). A white precipitate was formed. The conversion of pyrmethyl alcohol into pyrmethyl chloride was followed by HPLC, (column: Nova-Pak C 18, 4 µm, 3.9*150 mm). A fast reaction was recorded, reaching 99 % conversion after completed addition of thionyl
30 chloride.

Example 2

Pyrmethyl alcohol, 8.81 g (52.6 mmol), was dissolved in a mixture of toluene, 75 ml
5 (water content 0.04 mg/ml according to Karl Fisher titration) and water, 180 µl (10 mmol,
equivalent to about 2.4 mg /ml of water in toluene). To the stirred solution, at 10°C, thionyl
chloride, 8.15 g (68.5 mmol), was added slowly over 60 minutes (flow rate 0.083 ml/min).
A white precipitate was formed. The conversion of pyrmethyl alcohol into pyrmethyl
chloride was followed by HPLC as in Example 1. A fast reaction was recorded, reaching
10 99 % conversion after completed addition of thionyl chloride. The reaction temperature
was adjusted to 20°C and methanol, 40 ml, was added to stop the reaction. A solution of
the crude product, pyrmethyl chloride was obtained, with a purity of 99.6 % (HPLC), and
with a pyrmethyl alcohol residue of 0.3 %.

15 Example 3

Pyrmethyl alcohol, 8.82 g (52.7 mmol), was dissolved in toluene, 75 ml (water content
0.04 mg/ml according to Karl Fisher titration). To the stirred solution, at 10°C, thionyl
chloride, 8.15 g (68.5 mmol), was added slowly over 60 minutes (flow rate 0.083 ml/min).
20 A white precipitate was formed immediately. The obtained reaction mixture was stirred
and the reaction followed by HPLC, as in Example 1, for an additional 3.5 hours
(conversion declined and stopped at about 30%). Water, 180 µl (10 mmol), was added, to
re-start the reaction, yielding a high conversion (> 90%) within 30 minutes after the
addition.

25 Example 4

Pyrmethyl alcohol (8.8 g, 52.6 mmol) was dissolved in toluene (75 ml, water content 0.12
mg/ml) moistened with water (180 µl, 10 mmol) at room temperature. To the stirred
30 solution, at 25-30 °C, thionyl chloride (8.15 g, 68.5 mmole) was added slowly over 60 min.

(flow rate of 0.083 ml/min). Conversion of the reaction was analysed with HPLC as in Example 1. Conversion over 99.5%. Water (2.3 ml) was added to quench any excess of thionyl chloride.

- 5 An alkaline (13.5 g, 168.3 mmol 50 % w/w sodium hydroxide) aqueous (80 ml) solution of metmercazone (9.8 g, 54.2 mmol) was added followed by additional sodium hydroxide (8.8 g, 110.5 mmol, 50 % w/w sodium hydroxide) to reach pH>12.5. The temperature was allowed to increase to 45 °C during the additions. The reaction mixture was left with vigorous stirring for approximately two hours at 45 °C. The agitating was interrupted and
10 the phases were left to separate. The aqueous phase was discarded. The organic phase, comprising pyrimetazole, was washed with water and was analysed for residues of pyrimethyl alcohol (less than 0.1 %mol).

15 Example 5

- Pyrimethyl alcohol (8.8 g, 52.6 mmol) was dissolved in toluene (75 ml, water content 0.12 mg/ml) moistened with water (375 µl, 20.8 mmol) at room temperature. To the stirred solution, at 25-35 °C, thionyl chloride (9.33 g, 78.4 mmol) was added slowly over 60 min.
20 (flow rate of 0.095 ml/min). Conversion of the reaction was analysed with HPLC as in Example 1. Conversion over 99.5 %.

The synthesis continued in the same way as described in Example 4. The product phase, comprising pyrimetazole, was analysed for residue of pyrimethyl alcohol (less than 0.1 %mol).
